## world space week)

Pursuant to General Assembly Resolution No. 58 of December 6 to

December 1999, the Assembly recognized World Space Week

celebrate the contributions of space science and technology to improving the human condition.

World Space Week is the largest annual space-related event in the world.

It builds the workforce of the future by inspiring students, demonstrating public support for the space program, educating the public about space activities, and promoting international cooperation in space awareness and education. In 2018, more than 5,000 events were held in more than 80 countries to celebrate World Space Week.

It is a term that refers to the existence of life outside Earth or outside the solar system. The idea came from science fiction films that depicted life in space, which was strange in shape or existed under very difficult environmental conditions.

But the matter soon became serious, especially with scientific development and humans' better understanding of life, and this was supported by a number of scientists, most notably Albert Einstein, who said: There must be other life in several places in the galaxy, which contains millions of stars, which in turn contain planets and planets. Some planets here and there must be suitable for life, otherwise it is a miracle that the Earth alone contains life! Likewise, the progress of technology and modern science has prompted international agencies such as NASA to develop new theories and launch many missions to find an answer to the question that has been good to humanity since its creation, which is (Do humans exist on other planets in the universe?)
